In Topic 10, the focus is on understanding what division means, how to interpret division problems, and how to apply division strategies to solve various types of problems. This section explores the core ideas related to division within this topic.

### What Is Division?

Division is the process of determining how many times one number is contained within another or how to split a quantity into equal parts. It is often represented as a  $\div$  symbol or as a fraction.

- **Division as Sharing:** Distributing a total amount equally among a certain number of groups.
- **Division as Grouping:** Finding out how many groups of a certain size can be made from a total.

### Key Vocabulary in Division

Understanding specific terms helps students grasp division concepts more deeply.

- **Dividend:** The number being divided.
- **Divisor:** The number dividing the dividend.
- **Quotient:** The result of division.
- **Remainder:** The part of the dividend that is left over after division when it does not divide evenly.

## Division Strategies and Methods

Envision Math 4th Grade Topic 10 emphasizes various strategies to help students understand and perform division efficiently. These strategies build conceptual understanding and help students choose the most appropriate method for different types of problems.

### Using Fact Families

Fact families involve related multiplication and division facts that help students see the connection between these operations.

- For example, if  $3 \times 4 = 12$ , then  $12 \div 4 = 3$  and  $12 \div 3 = 4$ .
- Fact families reinforce understanding of division as the inverse operation of multiplication.

### Division with Arrays and Area Models

Visual models like arrays and area models make division more tangible.

- Arrays show how objects can be arranged into rows and columns to represent division.
- Area models partition a rectangle into equal parts to illustrate division problems.

### Long Division and Partial Quotients
