% Define control pins

stepPin = 'D2';

dirPin = 'D3';

% Set pins as outputs

configurePin(a, stepPin, 'DigitalOutput');

configurePin(a, dirPin, 'DigitalOutput');

% Define control parameters

stepsPerRevolution = 200; % depends on motor

stepDelay = 0.01; % seconds

% Rotate motor clockwise

for i = 1:stepsPerRevolution

writeDigitalPin(a, stepPin, 1);

pause(stepDelay);

writeDigitalPin(a, stepPin, 0);

## Understanding Stepper Motors and Their Significance

### What Are Stepper Motors?

Stepper motors are electromechanical devices that convert electrical pulses into discrete rotational movements. Unlike traditional DC motors, which offer continuous rotation, stepper motors move in fixed increments or steps, typically ranging from  $1.8^\circ$  to smaller fractions such as  $0.9^\circ$  or even  $0.1^\circ$ . This incremental movement allows for precise control over position and speed without the need for feedback sensors like encoders, although closed-loop variants do exist.

### Types of Stepper Motors

- Permanent Magnet Stepper (PM): Uses a rotor made of permanent magnets; suitable for applications requiring moderate torque.
- Variable Reluctance (VR): Features a rotor with salient poles; often used in high-speed, low-torque applications.
- Hybrid Stepper: Combines features of PM and VR types, providing higher torque, accuracy, and efficiency?making it the most common choice in precise control projects.

### Applications and Advantages

Stepper motors are favored for their:

- Precise positional control without feedback
- Ease of control with digital signals
- Good torque at low speeds
- Reliability and simplicity

They are employed in 3D printers, robotics, camera focusing systems, and automation machinery. Their main advantage lies in the ability to accurately control rotation angle, making them ideal for tasks demanding high precision.

## Core Principles of MATLAB-Based Stepper Motor Control

### Why Use MATLAB for Motor Control?
