Steps to Generate a Mohr Circle in MATLAB

Creating a Mohr circle in MATLAB involves a series of steps, from defining the stress components to plotting the circle with appropriate annotations.

1. Define the Stress Components

Begin by specifying the normal stresses (σ_x , σ_y) and shear stress (τ_{xy}) acting on the element.

```
```matlab
```

```
sigma_x = 50; % Normal stress in MPa
```

```
sigma_y = 20; % Normal stress in MPa
```

```
tau_xy = 15; % Shear stress in MPa
```

```
```
```

2. Calculate the Center and Radius of the Mohr Circle

The center (C) and radius (R) of the circle are derived from the stress components:

```
\[
```

$$C = \frac{\sigma_x + \sigma_y}{2}$$

```
\]
```

```
\[
```

$$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

]

``matlab

$$C = (\sigma_x + \sigma_y) / 2;$$

$$R = \sqrt{((\sigma_x - \sigma_y)/2)^2 + \tau_{xy}^2};$$

...

3. Define the Angle Range for Plotting

Choose a range of angles (θ) over which to plot the circle, typically from 0 to 180 degrees.

``matlab

$$\theta_{deg} = \text{linspace}(0, 180, 360);$$

$$\theta_{rad} = \text{deg2rad}(\theta_{deg});$$

...

4. Calculate the Stress Transformation Points

Using the stress transformation equations, compute the normal (σ_θ) and shear stresses (τ_θ) for each rotation angle:

[

$$\sigma_\theta = C + R \cos(2\theta)$$

]

[

$$\tau_\theta = R \sin(2\theta)$$

]

```
```matlab
```

```
sigma_theta = C + R cos(2 theta_rad);
```

```
tau_theta = R sin(2 theta_rad);
```

```
```
```

5. Plot the Mohr Circle

Use MATLAB's plotting functions to visualize the circle and stress points.

```
```matlab
```

```
figure;
```

```
circle_x = C + R cos(theta_rad);
```

```
circle_y = R sin(theta_rad);
```

```
plot(circle_x, circle_y, 'b', 'LineWidth', 2);
```

```
hold on;
```

```
% Plot the center point
```

```
plot(C, 0, 'ro', 'MarkerSize', 8, 'MarkerFaceColor', 'r');
```

```
% Plot the principal stresses
```

```
sigma_1 = C + R; % Max principal stress
```

```
sigma_2 = C - R; % Min principal stress
```

```
plot([sigma_1, sigma_2], [0, 0], 'ks', 'MarkerSize', 8, 'MarkerFaceColor', 'k');
```

```
% Add labels and title
```

```
xlabel('Normal Stress \sigma (MPa)');
```

```
ylabel('Shear Stress \tau (MPa)');
```

```
title('Mohr Circle in MATLAB');
```

```
grid on;
```

```
axis equal;
```

```
...
```

- Angles formed by tangents and chords: The measure of such an angle equals half the measure of the intercepted arc.

Arcs and Their Measures

- The measure of a minor arc equals the measure of its central angle.
- The measure of a major arc is greater than 180° .
- The measure of a semicircular arc (half the circle) is 180° .

Special Lines and Their Significance

Certain lines and points are crucial for understanding circle properties.

Tangent Lines

- Touch the circle at only one point.
- Are perpendicular to the radius at the point of tangency.
- Play a key role in circle theorems, such as the tangent-chord theorem.

Secants and External Points

- When a secant line passes outside the circle, it forms two segments with the circle.
- The power of a point theorem relates secants and tangents intersecting outside the circle.

Points of Tangency and Contact

- The unique point where a tangent touches the circle.

The vocabulary is often used to state and prove fundamental circle theorems:

- Theorem 1: The measure of an inscribed angle is half the measure of its intercepted arc.
- Theorem 2: Tangent line perpendicular to the radius at point of tangency.
- Theorem 3: Chords equidistant from the center are equal in length.
- Theorem 4: The angles between a tangent and a chord are equal to the inscribed angles subtended by the same arc.

Practical Applications and Problem-Solving Strategies
