Summary: The Stroop Effect study demonstrated the interference in reaction time when naming the ink color of words that spell different colors (e.g., the word "red" printed in blue ink). This work revealed automaticity in reading and laid the groundwork for understanding attentional control and cognitive interference.

Impact: It became a fundamental tool for studying selective attention, cognitive flexibility, and processing speed, influencing both experimental psychology and neuropsychological assessment.

2. The Serial Position Effect (1966) ? Murdock

Summary: Murdock's research showed that in free recall tasks, items at the beginning (primacy effect) and end (recency effect) of a list are remembered better than middle items, indicating different memory processes.

Impact: This study advanced models of memory, leading to the development of multi-store memory theories and influencing educational strategies.

3. The Mental Rotation Task (1971) ? Roger Shepard and Jacqueline Metzler

Summary: Participants mentally rotated three-dimensional objects to determine if they were the same or different, revealing that mental images are spatially represented and that rotation requires time proportional to angular disparity.

Impact: This research provided compelling evidence for visual-spatial processing in the mind, influencing cognitive neuroscience and theories of mental imagery.

Studies That Redefined Social Psychology

4. Milgram's Obedience Experiments (1961) ? Stanley Milgram

Summary: Participants believed they were administering painful electric shocks to others under authority instructions. A significant majority obeyed up to lethal levels, raising ethical questions but revealing obedience's power.

Impact: This study illuminated the social and psychological mechanisms behind authority, conformity, and obedience, influencing ethical standards in research and informing understanding of atrocities.
